

ENCLOSURE DIMENSIONS AND BARRIERS

Recording dimensions and barriers on your Enclosures.

Contact support@Species360.org

ZIMS allows you to record many details on your Enclosures. Two of these detail options can work together to form a complete picture of the size and construction of your Enclosures – the Dimensions and Barriers grids. Both of these grids are found under the More Details tab in the Enclosure record. Dimensions allow you to record the size of the Enclosure and its parts. Barriers allow you record what is keeping the animal in or the people out. Keeping these grids up to date can help you quickly answer questions from staff at other institutions, general public interest and inspectors without having to send someone out to measure or look. Does the enclosure meet the minimum square feet required for the species? Is the chain link a strong enough gauge to keep the animal in?

Dimensions

- 1.Dimension Measured – Free text field for what you are measuring. This must be unique within each Enclosure record.
- 2.Dimension Value – Free text field for the measurement taken.
- 3.Dimension Type – Data Standard for the type of dimension you are measuring.
- 4.Dimension UOM – Data Standard for various Units of Measure.
- 5.Measurement Date – The date you took the measurement. This can be helpful when enclosures are renovated and dimensions change, it sometimes helps to have a history captured.

It is the mission of Species360 to facilitate international collaboration in the collection and sharing of information on animals and their environments for zoos, aquariums and related organizations.

6.Description – Any details that will clarify the information recorded.

Barriers

1.Barrier Name – Free text field for what the barrier is. This must be unique within the grid but can be the same as the Dimension Measured.

2.Barrier Add Date – If you are catching up on entering your Barriers you can use the date that you recorded the data. But if you do know the date the Barrier was actually added, over time you can create a history of enclosure changes when combined with Barrier Removal Date.

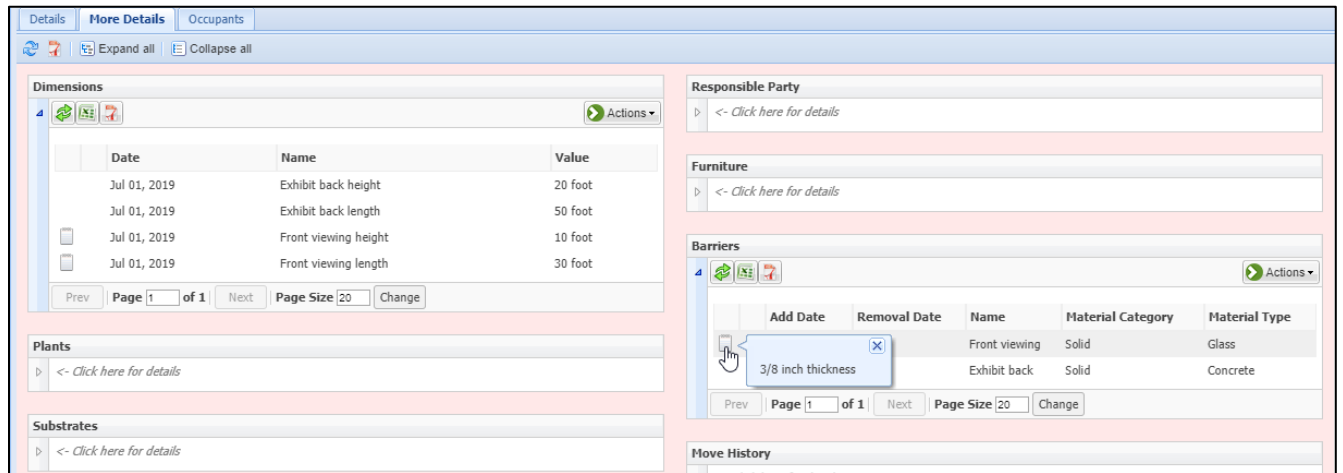

3.Barrier Material Category – A Data Standard of various categories that the Barrier can be made of. This field drives what displays in Barrier Material Type.

4.Barrier Removal Date – When the Barrier was removed and, over time, can provide a history of the enclosure.

5.Barrier Material Type –A Data Standard, driven by Barrier Material Category, that further describes the Barrier Material.

6.Details – Any details that will clarify the information recorded.

In our simple example here we can see that the Front viewing area is 3/8 inch glass 10 feet high by 30 feet long and the back wall is concrete 20 feet high by 50 feet long.

The screenshot displays the 'More Details' section of the Species360 interface. It features several data tables and sections:

- Dimensions:** A table with columns for Date, Name, and Value.

Date	Name	Value
Jul 01, 2019	Exhibit back height	20 foot
Jul 01, 2019	Exhibit back length	50 foot
Jul 01, 2019	Front viewing height	10 foot
Jul 01, 2019	Front viewing length	30 foot
- Responsible Party:** A section with a link to click for details.
- Furniture:** A section with a link to click for details.
- Barriers:** A table with columns for Add Date, Removal Date, Name, Material Category, and Material Type.

Add Date	Removal Date	Name	Material Category	Material Type
3/8 inch thickness		Front viewing	Solid	Glass
		Exhibit back	Solid	Concrete
- Plants:** A section with a link to click for details.
- Substrates:** A section with a link to click for details.
- Move History:** A section at the bottom right.

Revised 11 November 2019

It is the mission of Species360 to facilitate international collaboration in the collection and sharing of information on animals and their environments for zoos, aquariums and related organizations.
